Perlustro's standards setting forensics tools, will be coming to a browser near you very soon.

New announcements are also upcoming concerning new market demanded Electronic Discovery applications built unlike any tools that exist currently. Patent pending methods engineered by Perlustro can now provide never before seen economy to the EDRM process; from the lowest level imaging of 98% of all E-discovered systems used, to a secure Internet distribution end of the entire Ediscovery process. But providing that range does not mean it is required to succeed. These processes do not require imaging and they do not require internet distribution, either one, which is a characteristic which stands them apart from other ediscovery methods; specifically those that require network centricity or connectivity to function.
